

## Message Testing Made Easy™

TestIT™ provides automated testing solution for all types of message flows related to e-invoicing, e-payment, purchase orders, catalog updates etc.

## Improved quality

Automated testing shortens roll-out times, improves the overall quality of messages, and provides improved visibility to your entire network.

TestIT can also be a very powerful migration tool to fully comply with new message formats or regulatory standards with an immediate effect.

## Cost benefit

You can automate the testing of all your message flows as the deployment barrier of a new interface is very low. In other words, you will be able to cost-effectively manage even smallest message flows from SME companies who traditionally need a lot of hand-holding during the process.

Our initial customers have told horror stories about message testing that have taken weeks to fulfill, or postponed system rollouts and eventual reverting back to manual work because of badly tested systems.

Your payback time resulting from less hassle and not needed extra working hours should be less than six months.

## Our experience for your benefit

TestIT is a subsidiary of AgentIT. The management team consists of EDI and messaging veterans with close to 20 years of experience in tackling data interchange and electronic invoicing challenges.

BEST PRACTICES FOR CIO

## AUTOMATED TESTING FOR IMPROVED E-INVOICING DEPLOYMENT

### Are you ready for the big takeoff?

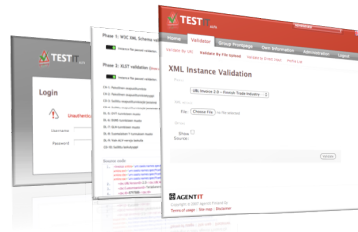

We believe that the time for a full-scale adoption of e-invoicing in Europe is finally here. Our mission is to streamline the business of e-invoicing operators through automated testing software and related services.

Our solution helps you untangle current bottlenecks in deployment and handle an increasing demand while meeting deadlines and increasing your customer satisfaction.

### Packetized best practices

TestIT is a system for validating the content of e-invoicing messages. Our system makes it possible to test data flows both in a technical and a logical way. The system provides understandable and formal testing reports covering the requirements of a whole data flow.

TestIT greatly reduces the time needed for business testing because the content of the messages is already tested during the implementation phase. Testing can also be done asynchronously; messages can be sent to system at any time and instant feedback is provided. This saves time and helps you avoid the typical implementation hassles.

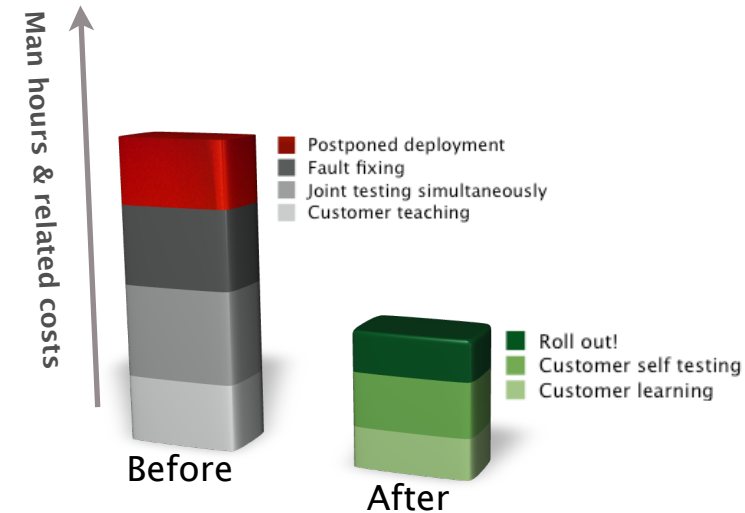

Traditional technical testing doesn't involve the rules and demands set by business, only the technical syntax of the message is validated. What's worse, the timely running of your business can be at the full mercy of your deployment resources. With TestIT you can change all that and even empower your customers to serve themselves!

TestIT offers a great way to communicate the changes of interfaces for all parties in coherent and structured way. The overall progress of testing of a certain interface can also be monitored easily. The testing

status of all trading partners can be seen in one understandable report.

TestIT can either be used as a ASP service or as a local installation in the customer server. The system is used and configured through web browser; no clients need to be installed on user workstations. The system supports all XML-based messages. Required functionality to support EDI formats (ANSI X.12, EDIFACT) is planned for version 2.
